PROFESSIONAL SUMMARY

Senior Full Stack Engineer with 6+ years building and shipping production systems across insurtech, fintech, and enterprise SaaS. At Afficiency, architected a schema-driven React and Flask platform serving 30,000+ insurance agents across 6+ carrier integrations and processing around \$5M in annual premium volume. Co-built a team-wide agentic AI workflow using Claude Code that cut feature delivery time by roughly 70%. Takes full ownership of what gets built, cares about product outcomes as much as code quality, and is looking for a senior IC role where that combination matters.

CORE COMPETENCIES

React.js / Next.js

Node.js / Flask

TypeScript / JavaScript

Python

PostgreSQL / MongoDB

AWS / Azure / GCP

Agentic AI Workflows

REST APIs / GraphQL

WORK EXPERIENCE

Afficiency Inc. - Senior Full Stack Engineer

Sep 2023 - Present

New York, NY

- Co-built a team-wide agentic AI engineering SOP using Claude Code, where structured specs and BRDs served as AI input artifacts before any code was written, each spec defining explicit constraints, mid-execution checkpoint questions, and acceptance criteria upfront. Drove full team adoption and cut feature delivery from weeks to roughly one week for large features and from days to same-day for smaller ones, with near-zero bug rates and end-to-end Playwright test coverage on every feature.
- Used this spec-driven workflow to help the team scale Monitorly from a solo-built session-replay tool into a full production observability platform, a browser session-recording SDK, a decoupled event-ingestion pipeline, and analytics dashboards with health scoring and real-time alerting, and to ship two additional systems the same way: "Application 360," an internal L2 diagnostic tool that aggregates application status, errors, and session data into a single investigator view, and an AI-assisted PDF generation engine that uses Claude to reverse-engineer insurance-form layouts into HTML templates, then renders production PDFs from those templates at scale.
- Architected the core platform serving 30,000+ agents across 6+ carriers: built a schema-driven React UI framework where product rules lived in JSON configs enabling zero-code carrier onboarding, and engineered Flask APIs with Redis caching that cut real-time policy quoting response times by 60%.
- Designed and specified an OTP-based eSignature verification system replacing SSN/DOB identity checks for legally signing a life insurance application, covering backend architecture (reusing existing trigger infrastructure rather than building new endpoints), dual-channel email/SMS delivery, SQL schema changes, and UI specs.
- Directed an agentic-AI-assisted migration of the production codebase from AWS to Azure in 3 days, including MySQL/Redis to PostgreSQL/Valkey, and restructured the agent-facing eApp codebase from a single repository into per-product repositories along the way.
- Consolidated 8 client-facing document signing and verification apps (consent, e-signature, ID verification, policy delivery) from 3 source repositories into a single monorepo in 5 days, eliminating cross-repo drift and simplifying deployments.
- Built Monitorly, an in-house session replay and error monitoring platform that replaced our LogRocket subscription, reduced tooling costs by 40%, gave both engineering and support teams direct visibility into live agent sessions, and drastically cut helpdesk ticket resolution times.
- Delivered 6+ major product features on a live \$5-\$8M premium platform including a fraud detection system using LexisNexis, PII deduplication, GIACT banking validation, and velocity checks; confirmed cases triggered carrier notification and agent commission suspension pending verification, keeping the platform at zero standing fraud cases.
- Built AffiHub, a full internal support ticketing system with workflow automation and agent assignment, after direct discovery sessions with the support team, replacing the team's HubSpot subscription entirely.
- Automated CI/CD pipelines with GitLab and Docker on Kubernetes, completed 2,000+ code reviews improving release consistency by 35%, and designed a phased testing strategy covering unit, contract, integration, and E2E tests.
- Built a reusable report-generation and SFTP transfer automation framework on EC2/S3, where new report jobs onboard by adding a single code/config pair without touching the scheduler, with S3-archived output, Teams notifications, and full run logging.

Systems Engineering Research Center (SERC) - Full Stack Developer

Jul 2022 - Jun 2023

Hoboken, NJ

- Designed and launched Helix, a behavioral research platform (React.js, Node.js, MySQL, AWS) used by 20,000+ active researchers, including a full frontend migration from PHP Laravel to a React SPA that improved performance by 40%.
- Built a secure REST API backend with RBAC and JWT authentication for sensitive research data, and a reusable React component library that cut code duplication by 50% and improved feature velocity by 25%.
- Deployed to AWS EC2 via Docker and GitHub Actions CI/CD, achieving sub-15-minute deployments and 99.9% uptime across the platform.

LTI (Larsen & Toubro Infotech) - Software Engineer

Jan 2019 - Jul 2021

Navi Mumbai, India

- Worked on a MERN stack enterprise application on AWS serving 50,000+ global users, contributing to real-time data sync, analytics dashboards, and 200+ REST API endpoints.
- Improved API response times by 10x using Redis caching and optimized MongoDB aggregation pipelines, bringing average latency from 3s to 300ms. Helped migrate a monolithic Node.js backend into microservices and pushed automated test coverage to 80%.

PROJECTS

Monitorly React.js | Flask | PostgreSQL | AWS S3 | WebSockets

In-house session replay and observability platform built to replace LogRocket. Tracks agent sessions, page interactions, errors, and API calls in real time, saving 40% in tooling costs while giving engineering and support full production visibility.

AffiHub React.js | Node.js | Flask | PostgreSQL | AWS

Internal support ticketing system covering ticket creation, agent assignment, workflow automation, and status tracking. Built to replace the team's HubSpot subscription after direct discovery with the support team.

JumpToCode - React Developer Chrome Extension React Fiber | Node.js | Express | VS Code CLI

Chrome DevTools extension that traverses the React Fiber tree to map live UI components to their exact source file and line, enabling one-click navigation into VS Code via a local Express bridge.

MultiPDF ChatBot AI Python | LangChain | Hugging Face | FAISS | Streamlit

AI chatbot for conversational search across multiple PDFs using LangChain, FAISS vector retrieval, and the Instructor-XL embedding model, with a Streamlit interface for real-time multi-file responses.

TULSEE - Team Collaboration Platform React | Node.js | MongoDB | Socket.io | Firebase | Zoom API

Full-stack team workspace with real-time encrypted group chat, task management, file uploads, Google SSO, and Zoom API integration for in-app meeting scheduling.

EDUCATION

Master of Science in Computer Science - Stevens Institute of Technology

Aug 2021 - May 2023

Hoboken, NJ | GPA: 3.84 | Provost's Master's Scholarship

Bachelor of Science in Computer Science - University of Mumbai

May 2015 - Jun 2018

Mumbai, India | GPA: 3.5

SKILLS

Languages: JavaScript (ES6+), TypeScript, Python, SQL, HTML/CSS

Frontend: React.js, Next.js, Vue.js, React Native, Redux, Zustand, React Query, Expo, Chakra UI

Backend: Node.js, Express, Flask, FastAPI, GraphQL, REST APIs, Microservices, Socket.io

AI / LLMs: Claude Code, Claude APIs (Anthropic), LangChain, Hugging Face, RAG pipelines, FAISS, Prompt Engineering

Databases: PostgreSQL, MySQL, MongoDB, Redis, Valkey, SQLAlchemy, SQL Server

Cloud & DevOps: AWS (EC2, S3, CloudFront, Cognito, Lambda), Azure, GCP, Kubernetes, Docker, NGINX, Firebase, CI/CD

Tools & Practices: Git, GitLab, GitHub Actions, Playwright, Postman, New Relic, JIRA, Agile/Scrum, Figma
